SmartFrog Velocity Components

2 Feb 2011

1 Introduction

Apache Velocity, from <http://velocity.apache.org/> is a simple template language which can be used to insert directives into text files. When these files are passed through the *Velocity Engine*, the directives are interpreted to generate new files. The engine can be used to generate text files, or even dynamically create HTML content.

The SmartFrog Velocity Components provide

- The Apache Velocity JAR itself.
- A component which passes a file (or resource on the classpath) through the velocity engine; it integrates velocity logging and error reporting with SmartFrog.

The documentation for this component package is hosted on SmartFrog's wiki pages. Please consult the page <http://wiki.smartfrog.org/wiki/display/sf/sf-velocity> for information about the component and how to use it
